Pre Calculus 11: HW Section 8.2 Solving Systems of Equations by Elimination

1. Solve each system by using elimination:

<p>i) $2x + 3y = 18$ \odot $2x - 3y = -6$ \odot $4x + 0 = 12$ $\odot + \odot$ $x = 3$ Substitute $x = 3$ into $2x + 3y = 18$ $2(3) + 3y = 18$ $6 + 3y = 18$ $3y = 12$ $y = 4$ $\therefore (3, 4)$</p>	<p>ii) $7x - 4y = 26$ \odot $3x + 4y = -6$ \odot $10x + 0 = 20$ $\odot + \odot$ $x = 2$ Plug $x = 2$ back into $7x - 4y = 26$ $7(2) - 4y = 26$ $14 - 4y = 26$ $-4y = 12$ $y = -3$ $\therefore (2, -3)$</p>
<p>iii) $y = x^2 - 16x + 60$ \odot $y = 12x - 55$ \odot $0 = x^2 - 28x + 115$ $\odot - \odot$ $0 = (x-5)(x-23)$ $x = 5$ or $x = 23$ Substitute $x = 5$ into $y = 12x - 55$ $y = 12(5) - 55 = 60 - 55 = 5$ Substitute $x = 23$ into $y = 12x - 55$ $y = 12(23) - 55 = 276 - 55 = 221$ $\therefore (5, 5)$ and $(23, 221)$</p>	<p>iv) $2y^2 + 20y + x = -40$ \odot $7y + 2x + 26 = 0$ \odot $4y^2 + 40y + 2x = -80$ \odot $7y + 2x + 26 = 0$ \odot $4y^2 + 33y + 54 = -80$ $\odot - \odot$ $4y^2 + 33y + 134 = -80$ $4y^2 + 33y + 214 = 0$ $(4y+19)(y+11) = 0$ $4y+19 = 0$ or $y+11 = 0$ $y = -\frac{19}{4}$ or $y = -11$ Substitute $y = -11$ into $7y + 2x + 26 = 0$ $7(-11) + 2x + 26 = 0$ $-77 + 2x + 26 = 0$ $2x = 51$ $x = \frac{51}{2}$ $\therefore (\frac{51}{2}, -11)$</p>
<p>v) $2x - 5 = 3y$ \odot $2x^2 - 5x = y$ \odot $6x^2 - 15x = 3y$ \odot $6x^2 - 17x - 5 = 0$ $\odot - \odot$ $6x^2 - 17x - 5 = 0$ $(3x+1)(2x-5) = 0$ $3x+1 = 0$ or $2x-5 = 0$ $x = -\frac{1}{3}$ or $x = \frac{5}{2}$ Substitute $x = \frac{5}{2}$ into $2x - 5 = 3y$ $2(\frac{5}{2}) - 5 = 3y$ $5 - 5 = 3y$ $0 = 3y$ $y = 0$ $\therefore (\frac{5}{2}, 0)$ and $(-\frac{1}{3}, -\frac{11}{3})$</p>	<p>vi) $x^2 + 40x - y + 400 = 0$ \odot $x^2 = y + 30x - 225$ \odot $x^2 + 40x + 400 = y + 30x - 225 + y$ $x^2 + 40x + 400 = x^2 + 30x - 225 + 2y$ $10x + 625 = 2y$ $5x + 312.5 = y$ Substitute $y = 5x + 312.5$ into $x^2 + 40x - y + 400 = 0$ $x^2 + 40x - (5x + 312.5) + 400 = 0$ $x^2 + 35x + 87.5 = 0$ $(x+7)(x+12.5) = 0$ $x = -7$ or $x = -12.5$ Substitute $x = -7$ into $y = 5x + 312.5$ $y = 5(-7) + 312.5 = -35 + 312.5 = 277.5$ Substitute $x = -12.5$ into $y = 5x + 312.5$ $y = 5(-12.5) + 312.5 = -62.5 + 312.5 = 250$ $\therefore (-7, 277.5)$ and $(-12.5, 250)$</p>

i) $2x + 3y = 18$
 $-2x - 3y = -6$

 $6y = 24$
 $y = 4$
 $2x + 3(4) = 18$
 $2x + 12 = 18$
 $2x = 18 - 12$
 $2x = 6$
 $x = 3$
 SOLUTION: $(3, 4)$

<p>vii) $2x^2 + 5x - 2y = 0$ \odot $0 = y + 3x + 6$ \odot $2x^2 + 5x - 2y = 0$ $12 + 6x + 2y = 0$ \odot $2x^2 + 11x + 12 = 0$ $\odot - \odot$ $2x^2 + 11x + 12 = 0$ $(2x+3)(x+4) = 0$ $2x+3 = 0$ or $x+4 = 0$ $x = -\frac{3}{2}$ or $x = -4$ Substitute $x = -4$ into $0 = y + 3x + 6$ $0 = y + 3(-4) + 6$ $0 = y - 12 + 6$ $0 = y - 6$ $y = 6$ $\therefore (-\frac{3}{2}, \frac{15}{2})$ and $(-4, 6)$</p>	<p>viii) $15x^2 + 8x = y$ \odot $2 + 9x + y = 0$ \odot $15x^2 + 8x - y = 0$ \odot $2 + 9x + y = 0$ \odot $15x^2 + 17x + 2 = 0$ $\odot - \odot$ $15x^2 + 17x + 2 = 0$ $(3x+2)(5x+1) = 0$ $3x+2 = 0$ or $5x+1 = 0$ $x = -\frac{2}{3}$ or $x = -\frac{1}{5}$ Substitute $x = -\frac{1}{5}$ into $2 + 9x + y = 0$ $2 + 9(-\frac{1}{5}) + y = 0$ $2 - \frac{9}{5} + y = 0$ $\frac{10}{5} - \frac{9}{5} + y = 0$ $\frac{1}{5} + y = 0$ $y = -\frac{1}{5}$ $\therefore (-\frac{2}{3}, -\frac{1}{3})$ and $(-\frac{1}{5}, -\frac{1}{5})$</p>
<p>ix) $x + y = 0$ \odot $x^2 - y = 2$ \odot $y = -x$ $x^2 - (-x) = 2$ $x^2 + x = 2$ $0 = x^2 + x - 2$ $0 = (x+2)(x-1)$ $x = -2$ or $x = 1$ Substitute $x = -2$ into $x + y = 0$ $-2 + y = 0$ $y = 2$ Substitute $x = 1$ into $x + y = 0$ $1 + y = 0$ $y = -1$ $\therefore (-2, 2)$ and $(1, -1)$</p>	<p>x) $x^2 + x + 4 = y$ \odot $8x + 4 = y$ \odot $x^2 + x + 4 = 8x + 4$ $x^2 + x + 4 - 8x - 4 = 0$ $x^2 - 7x = 0$ $x(x-7) = 0$ $x = 0$ or $x = 7$ Substitute $x = 0$ into $8x + 4 = y$ $8(0) + 4 = y$ $y = 4$ Substitute $x = 7$ into $8x + 4 = y$ $8(7) + 4 = y$ $56 + 4 = y$ $y = 60$ $\therefore (0, 4)$ and $(7, 60)$</p>

2. The lines with equations $px + 3y = 15$ and $6x + qy = 30$ pass through the point $(4, -3)$. What is the value of $p+q$?

$4p + 3(-3) = 15$
 $4p - 9 = 15$
 $4p = 24$
 $p = 6$

$6(4) + q(-3) = 30$
 $24 - 3q = 30$
 $-3q = 6$
 $q = -2$

$\therefore p+q = 6 + (-2) = 4$

3. Line "A" passes through the points $(3,0)$ and $(-9,9)$ and line "B" passes through the points $(-5,0)$ and $(4,6)$. What is the intersection point between lines "A" and "B"?

Line A: $y - 0 = \frac{9 - 0}{-9 - 3}(x - 3)$
 $y = \frac{9}{-12}(x - 3)$
 $y = -\frac{3}{4}(x - 3)$
 $y = -\frac{3}{4}x + \frac{9}{4}$

Line B: $y - 0 = \frac{6 - 0}{4 - (-5)}(x - (-5))$
 $y = \frac{6}{9}(x + 5)$
 $y = \frac{2}{3}(x + 5)$
 $y = \frac{2}{3}x + \frac{10}{3}$

Intersection: $-\frac{3}{4}x + \frac{9}{4} = \frac{2}{3}x + \frac{10}{3}$
 $-\frac{3}{4}x - \frac{2}{3}x = \frac{10}{3} - \frac{9}{4}$
 $-\frac{9x}{12} - \frac{8x}{12} = \frac{40}{12} - \frac{27}{12}$
 $-\frac{17x}{12} = \frac{13}{12}$
 $-17x = 13$
 $x = -\frac{13}{17}$

Substitute $x = -\frac{13}{17}$ into $y = \frac{2}{3}x + \frac{10}{3}$
 $y = \frac{2}{3}(-\frac{13}{17}) + \frac{10}{3}$
 $y = -\frac{26}{51} + \frac{170}{51}$
 $y = \frac{144}{51}$
 $y = \frac{48}{17}$
 $\therefore (-\frac{13}{17}, \frac{48}{17})$

$$x=5, y=-3$$

4. The following system has (5,-3) as a solution. What are the values of "a" and "b"?

$$\begin{aligned} ax+by &= -11 \rightarrow 5a + -3b = -11 & 5a - 3b &= -11 \\ 2ax - 3by &= 8 \rightarrow 2(a)(5) - 3(b)(-3) = 8 & 5a &= -11 + 6 \\ & & 5a &= -5 \\ & & \underline{a} &= \underline{-1} \\ 5a - 3b &= -11 \rightarrow x^2 \rightarrow 10a - 6b = -22 \text{ (1)} & & \\ 10a + 9b &= 8 & \text{Subst} & \\ \hline 15b &= 30 & \text{(1)-(1)} & \\ \underline{b} &= \underline{2} & & \end{aligned}$$

5. In the diagram, "V" is the vertex of the parabola with equations $y = -x^2 + 4x + 1$. Points "A" and "B" are intersections between the parabola and the line $y = -x + 1$. Find the distance from point "A" to "B".

6. The lines $bx + y = 30$ and $x + by = c$ intersect at the point P(6,12), determine the value of "c".

$$\begin{aligned} \textcircled{1} \quad x &= 6, y = 12 \\ 6b + 12 &= 30 & 6 + b(12) &= c \\ 6b &= 18 & 6 + 3(12) &= c \\ \underline{b} &= \underline{3} & 6 + 36 &= c \\ & & \underline{42} &= \underline{c} \end{aligned}$$

7. Determine all ordered pairs (x,y) that satisfy the following system of equations:

$$\begin{aligned} x + y &= 16 \rightarrow y = 16 - x & x &= 14 & x &= 2 \\ \frac{4}{7} = \frac{1}{x} + \frac{1}{y} & \rightarrow \frac{4}{7} = \frac{1}{x} + \frac{1}{16-x} & y &= 2 & y &= 14 \\ \textcircled{1} \quad 4(16-x) &= 7(x)(16-x) & \therefore & (14, 2) & \text{ ; } & (2, 14) \\ 4(16-x) &= 7(16-x) + 7(x) \\ 64x - 4x^2 &= 112 - 7x + 7x^2 \\ 0 &= 4x^2 - 64x + 112 \\ 0 &= x^2 - 16x + 28 \\ 0 &= (x-14)(x-2) \\ x &= 14, x = 2 \end{aligned}$$

3

8. If $(x+1)(x-1) = 8$, then what is the value of $(x^2+x)(x^2-x)$

$$\begin{aligned} \textcircled{1} \quad x^2 - 1 &= 8 \\ x^2 &= 9 \\ \textcircled{2} \quad x(x+1)(x)(x-1) &=? \\ x^2(x+1)(x-1) &=? \\ 9(8) &=? \\ \underline{\underline{72}} &=? \end{aligned}$$

9. The line $y = 2x + 2$ intersects the parabola $y = x^2 - 3x + c$ at two points. One of these points is (1,4). Determine the coordinates of the second point of intersection.

$$\begin{aligned} \textcircled{1} \quad x &= 1, y = 4 & \textcircled{2} \quad 2x + 2 &= x^2 - 3x + c \\ 4 &= 1^2 - 3(1) + c & 0 &= x^2 - 5x + 4 & \therefore (1, 4) & \text{ ; } (4, 10) \\ 4 &= 1 - 3 + c & 0 &= (x-4)(x-1) \\ 4 &= -2 & x &= 4, x = 1 \\ \underline{6} &= \underline{c} & y &= 10, y = 4. \end{aligned}$$

10. Solve the system:
 $x^2 - xy + 8 = 0$
 $x^2 - 8x + y = 0$

$$\begin{aligned} \text{hint: } x^2 + y &= xy & \text{and } y &= -x^2 + 8x \\ \frac{x^2 + y}{x} &= y \end{aligned}$$
