

HW Math 8 Section 9.3 Volume of Cylinders

1. Given each cylinder, find the volume:

<p>a) $h = 5\text{cm}$, $r = 3\text{cm}$</p> 	<p>b)</p> 
<p>c)</p> 	<p>d) $h = 32\text{cm}$, $d = 40\text{cm}$</p> 
<p>e) $x = 15\text{cm}$, $y = 4\text{cm}$</p> 	<p>f)</p> 

2. There are two cylinders that carry candy in them. One cylinder is 25cm tall and has a radius of 15cm. The second cylinder has a height of 15cm tall and a radius of 15cm. Which cylinder has a bigger volume?

3. If the volume of the following cylinder is 108cm^3 , then what is the height?

4. A cylindrical water tank is $\frac{1}{5}$ full. If three liters were added, the tank would be $\frac{1}{4}$ full. How many liters does the tank hold when it is full? If the height of the cylinder is 50cm, what is the radius of the cylinder? [Note: $1\text{L} = 1000\text{ml} = 1000\text{cm}^3$]

5. What is the volume of the solid below if a right triangle

6. A pipe is 2 meters long and has inside radius of 5 cm and outside radius of 6 cm. Find the volume of metal contained in the pipe to the nearest cubic centimetre

7. The lateral surface area of a cylindrical tube with a height of 6 cm is $48\pi \text{ cm}^2$. In cubic centimeters, what is the tube's volume? Express your answer in terms of π .

8. A soft drink company has two different cans. One container is twice as wide as another but only half as tall. Which container has a bigger volume? A or B? Do they hold the same amount?

9. Challenge: Cylinder B's height is equal to the radius of cylinder A and cylinder B's radius is equal to the height (h) of cylinder A. If the volume of cylinder A is twice the volume of cylinder B, the volume of cylinder A can be written as $V = N \times \pi \times h^3$ cubic units. What is the value of N?
