D) MEASURING ANGLES IN DEGREES

- When working with angles of rotation:
 - Counter clockwise:
 - Clockwise:
- Begin on the right side at zero degrees

II) CIRCUMFERENCE & RADIANs:

- The circumference of a circle is given by the equation:

$$\pi = 3.141592654.....$$
- The radian is a unit for angle measurement
- Based on measuring the
- 1 radian is equal to an angle created by

III) CONVERTING DEGREES TO RADIANs:

- Angles in degrees will correspond with a value in radians
- Radians can be written as a fraction or a multiple of π

Degrees	Radians
0°	
30°	
45°	
60°	
90°	
180°	
270°	
360°	

- To convert degrees into radians, multiply the fraction by $\frac{\pi}{180^\circ}$

Ex: Convert the following to radian measure:

i) $135^\circ \rightarrow 135^\circ$

ii) $225^\circ \rightarrow 225^\circ$

iii) $305^\circ \rightarrow 305^\circ$

iv) $280^\circ \rightarrow 280^\circ$

- In contrast, to convert from radians to degrees, multiply the value by: $\frac{180^\circ}{\pi}$

Ex: Convert the following to degrees:

i) $\frac{5\pi}{3} \rightarrow$

ii) $\frac{8\pi}{13} \rightarrow$

iii) $6.337 \text{ rad.} \rightarrow$

iv) $0.471 \text{ rad.} \rightarrow$

IV) FINDING THE ARC LENGTH OF A CIRCLE

- The arc length is a fraction of the circumference of the circle
- The fraction is given by the central angle divided by the 2π

- If the central angle is given in degrees, you must

Ex: An arc with a radius of 5m has a central angle of 2.5 radians. Find the arc length.

Practice: An arc with a radius of 7m has a central angle of 177.4° . Find the arc length.

Practice: An arc with a radius of 2.4m has an arc length of 5.3m. Find the central angle in radians and degrees.

V) REVIEW: QUADRANTS & X/Y AXIS

VI) UNIT CIRCLES & ROTATIONS

- o A “unit circle” is a circle rotated around the origin with
- o The radius starts to rotate from
- o The line rotating around the center is called a “Terminal Arm”
 - Rotated Counter clock-wise
 - Rotated Clock-wise

VII) ANGLES IN STANDARD POSITION:

- o All angles in “standard position” begin
- o The angle is created by rotating the

Ex: Draw the following angles in standard position:

a) 62°

b) 152°

Ex: Draw the following angles in standard position:

a) 312°

b) -77°

c) 2.5π radians

d) 9.42 radians

VIII) CO-TERMINAL ANGLES

- Angles that have their terminal arms at the same position
- Co-terminal angles have a difference

ie: 30° , 390° , 750° , -330° , -330° , -690° , ..etc

Ex: Given the following angles, provide two co-terminal angles and a formula for all the co-terminal angles

i) 123°

ii) $\frac{7\pi}{3}$

IX) REFERENCE ANGLES

- An angle created by the
- Reference angles must be in the

Ex: Given the following angles in standard position, find the reference angle

i) 152° in standard position

ii) 255° in standard position

Ex: Given each of the following terminal arms, indicate which is the reference angle:

© Copyright all rights reserved to Homework depot: www.BCMath.ca

Practice: Find the reference angle for each of the following angles in standard position:

i) $\frac{7\pi}{3}$

ii) -6.78 radians

PRACTICE: FIND THE REFERENCE ANGLE FOR EACH OF THE FOLLOWING ANGLES IN STANDARD POSITION

i) $\frac{4\pi}{3}$

ii) $\frac{5\pi}{6}$

iii) $-\frac{5\pi}{4}$

iv) $\frac{12\pi}{5}$

IX) RECOGNIZING REFERENCE ANGLES

- Angles with the same height will have the same reference angle
ie: 30° , 150° , 210° , and 330° all have the same reference angle at 30°
ie: 60° , 120° , 240° , and 300° all have the same reference angle at 60°
ie: 45° , 135° , 225° , and 315° all have the same reference angle at 45°

RECOGNIZING SPECIAL ANGLES IN RADIAN FORM
